

Crewwork Sales Proposal Agent

From a sales call to a sent-and-tracked DocuSign proposal using local AI and no paid LLM APIs.

Capability Sales-call-to-agreement automation	AI Qwen 3 1.7B via Ollama	Action layer DocuSign MCP
Demo deal NorthStar Home Services	Demo value USD 7,500	Follow-up Human-reviewed nudge draft

1. Capability

What shipped? A code-first Sales Proposal Agent that takes a sales-call transcript, extracts structured deal data locally, applies deterministic rate-card pricing, renders a proposal, and uses DocuSign MCP to create, populate, send, and verify an agreement envelope.

Source: [DocuSign MCP Connectors - official product page](#)

At submission time (Sep 19, 2026), the DocuSign MCP Server is described by DocuSign as open beta. DocuSign announced general availability for Sep 30, 2026.

2. Why this matters

The workflow closes the repetitive gap between a completed sales call and a proposal being ready for signature. Requirements, pricing, proposal fields, agreement status, and follow-up remain connected.

3. Caveat

The reusable DocuSign template is created once in the DocuSign console. Recipient tab IDs are rediscovered for every envelope. Follow-up is draft-only and never auto-sent.

4. Business pain

Specific ICP pain: after a discovery call, an AI-services sales team has to turn unstructured conversation into a priced proposal, send it for signature, and remember to follow up on unsigned agreements. These handoffs add repetitive operational work and can delay the proposal.

5. Why this pairing makes sense

DocuSign MCP is used as the agreement action layer. The local model handles natural-language extraction, while Python owns deterministic business logic: deal IDs, service matching, pricing, validation, send state, and nudge timing.

6. Workflow

Input -> AI reasoning -> structured JSON -> deterministic pricing -> proposal -> DocuSign MCP -> validation -> action -> status verification -> human-reviewed follow-up

7. Implementation

Component	Implementation
AI extraction	extract_deal.py -> local Ollama endpoint -> qwen3:1.7b -> validated JSON
Deal identity	Client-name slug + first 12 hex chars of SHA-256 of normalized transcript, computed in Python
Pricing	match_services.py -> exact case-insensitive service-name matching against rate_card.json
Proposal	render_proposal.py -> proposal_template.j2 -> generated_proposal.txt
DocuSign	send_proposal.py -> createEnvelope -> listRecipients -> updateEnvelopeTabs -> verify -> send -> getEnvelope
Reliability	state.json with send_attempted marker written before the real send; duplicate-send guard by deal_id
Follow-up	check_nudges.py -> getEnvelope -> 48h unsigned threshold -> local draft only

Step 1. Configure input

The pipeline starts from a plain-text sales call. It contains the company, requested solutions, scope, deliverables, and timeline.

What the screenshot proves: Input is natural language; pricing is not inferred from the transcript.

Sales Rep: Thanks for joining. From our earlier conversation, it sounds like your team wants to automate some of the customer support and internal knowledge workflows.

Client: Yes. We have technician documents, service manuals, troubleshooting guides, and internal SOPs. Our support team currently searches through those manually.

Sales Rep: So one part would be a knowledge assistant that can retrieve the right information from those documents.

Client: Exactly. We want a RAG-based assistant for our support team.

Sales Rep: You also mentioned wanting an AI agent that can actually execute some repetitive workflows rather than only answer questions.

Client: Right. We want the agent to handle routine customer-facing workflows, collect information, trigger the appropriate internal process, and escalate anything it cannot handle.

Sales Rep: For the first phase, we'd scope the RAG assistant, the AI agent workflow, deployment, and documentation.

Client: That sounds right. We'd like the first version in about four to six weeks.

Sales Rep: Great. Based on the current scope, we'll prepare the proposal and send it for approval.

Client: Perfect. Please send that over to us.

Step 2. Send data to model

extract_deal.py calls the local Ollama endpoint and asks qwen3:1.7b to return structured deal facts.

What the screenshot proves: The model is used for extraction only. Pricing remains outside the model.

```
ber 2026 presentation run."
• (.venv) PS C:\Users\kirti_jagtap\OneDrive\Desktop\docusign_sales_agent_step1\docusign_sales_agent_step1> python extract_deal.py demo_sales_transcript.txt
Calling local Ollama model: qwen3:1.7b
SUCCESS: deal.json written.
{
  "deal_id": "northstar-home-services-b5f46baa2a5c",

  "client_email": "",
  "services_discussed": [
    "RAG Knowledge Assistant",
    "AI Agent Development"
  ],
  "rough_scope": "The first phase would include the RAG assistant, AI agent workflow, deployment, and documentation.",
  "deliverables": [
    "RAG assistant",
    "AI agent workflow",
    "Deployment",
    "Documentation"
  ],
  "timeline": "The first version will be delivered in about four to six weeks."
}
```

Step 3. Parse structured output

The model output is validated before downstream processing. The recipient email is supplied separately when it is not present in the transcript.

What the screenshot proves: Required fields are captured in JSON; the demo recipient email is redacted in this document.

```
}
• (.venv) PS C:\Users\kirti_jagtap\OneDrive\Desktop\docusign_sales_agent_step1\docusign_sales_agent_step1> notepad .\deal.json

    "RAG assistant",
    "AI agent workflow",
    "Deployment",
    "Documentation"
  ],
  "timeline": "The first version will be delivered in about four to six weeks."
}
```

Step 4. Apply deterministic pricing

match_services.py matches the extracted services against rate_card.json. The demo selected RAG Knowledge Assistant and AI Agent Development.

What the screenshot proves: RAG Knowledge Assistant = USD 3,500; AI Agent Development = USD 4,000; total = USD 7,500.

```
{
  "deal_id": "northstar-home-services-b5f46baa2a5c",
  "client_name": "NorthStar Home Services",
  "client_email": "ajayjagtap5001@gmail.com",

      "scope": "Agentic workflow with tool calling, task execution, error handling, and deployment."
    }
  ],
  "currency": "USD",
  "total_price": 7500
}
```

Step 5. Generate action-ready proposal

render_proposal.py combines the structured deal, matched services, and Jinja template into a local proposal preview. The DocuSign document then carries the populated fields.

Proposal content preview

Prepared for: NorthStar Home Services

PROJECT OVERVIEW

The first phase would include the RAG assistant, AI agent workflow, deployment, and documentation.

SCOPE

RAG Knowledge Assistant; AI Agent Development

DELIVERABLES

RAG assistant; AI agent workflow; Deployment; Documentation

TIMELINE

Four to six weeks

INVESTMENT

USD 7,500

DocuSign Envelope ID: FC8C2C9E-FCFB-8A40-8174-C846539313EF

SALES PROPOSAL

Crewwork Labs

ClientName: NorthStar Home Services

ProjectOverview: The first phase would include the RAG assistant, AI agent workflow, deployment, and documenta

SCOPE OF WORK

Scope: RAG Knowledge Assistant: Retrieval-augmented generation assistant using a vector database, document in

DELIVERABLES

Deliverables: RAG assistant, AI agent workflow, Deployment, Documentation

Timeline: The first version will be delivered in about four to six weeks.

INVESTMENT

TotalFee: USD 7500

NEXT STEPS

Upon approval, this proposal will be sent through DocuSign for electronic signature.

CLIENT SIGNATURE

Signature:

Date:

Internal template note: Replace the [...] placeholders with DocuSign sender-fillable Text fields. Add the actual Signature field assigned to the Client recipient role inside DocuSign.

Left: clean content preview. Right: supplied DocuSign document export from the demo.

Step 6. Call external tool / action

The send path creates a draft envelope, discovers the current Client recipient and per-envelope tab IDs, populates six fields, verifies them, records send_attempted, sends the envelope, and calls getEnvelope for the authoritative status.

SalesContracts

Step 8. Apply validation + human review

Local state ties the deal to the DocuSign envelope and preserves sent status. The nudge checker re-reads the envelope status and drafts a follow-up only when it remains unsigned beyond the threshold. Production threshold: 48 hours; demo threshold was temporarily overridden.

```
},

REDACTED FOR SUBMISSION NorthStar Home Services

Hi NorthStar Home Services,

Just following up on the proposal we sent over - wanted to check it reached you okay and see if you have any questions before signing.

(DocuSign envelope: fc8c2c9e-fcfb-8a40-8174-c846539313ef)

Happy to jump on a quick call if anything needs clarifying.

Thanks,
Crework Sales Agent
```

Nudge draft: human review only; no send path.

8. Result

The build was demonstrated end-to-end with a fresh NorthStar Home Services deal.

Stage	Observed result
Input	Sales transcript loaded successfully
AI extraction	Structured deal JSON written locally
Pricing	2 services matched; total USD 7,500
Proposal	Proposal content rendered successfully
DocuSign action	Envelope created, fields populated, validation passed, sent
Status	Authoritative status = sent
Follow-up	Unsigned envelope produced a local nudge draft

Core design principle

The local LLM understands the conversation, deterministic code owns business logic and pricing, DocuSign MCP performs the external agreement action, and local state makes the workflow reliable.

9. GIF

The accompanying GIF is assembled from the exact supplied evidence screenshots in workflow order. Because the source material is screenshots rather than a screen recording, the GIF is an evidence walkthrough rather than a fabricated animation of hidden tool calls.

Separate deliverable: Crework_Sales_Proposal_Agent_Workflow.gif

10. Other ideas

DocuSign MCP + client onboarding

Use agreement actions as the final step in a new-client onboarding workflow, while retaining human approval where needed.

Stateless MCP + internal tool lookup

Use stable local workflow state to remember what an agent has already done while MCP provides standardized access to internal or external tools.

Meta Muse + WhatsApp DM response

Use a multimodal capability to draft context-aware customer DM replies for human review. Not built in this submission.
